

Diluting Solutions

Dilution: to make a solution less concentrated by adding more solvent

~ the number of molecules, or moles, of solute that is present remains the same before and after dilution ~

$$\begin{array}{ccc} \text{initial volume (L)} & \xrightarrow{\quad} & \text{final concentration (mol/L)} \\ & \searrow \quad \swarrow & \\ & \boxed{C_1 V_1 = C_2 V_2} & \\ & \swarrow \quad \searrow & \\ \text{initial concentration (mol/L)} & \xrightarrow{\quad} & \text{final volume (L)} \end{array}$$

Example problems

(i) ~ calculating initial volume ~

For an experiment, you must make 2.0L of 0.10 mol/L sulfuric acid. The acid is usually sold as an 18 mol/L concentrated solution. How much of the concentrated solution should be used to make a new solution?

1- write the given information

$$\begin{aligned} C_1 &= 18 \text{ mol/L} \\ V_1 &= ? \\ C_2 &= 0.10 \text{ mol/L} \\ V_2 &= 2.0 \text{ L} \end{aligned}$$

2- use formula
 $C_1 V_1 = C_2 V_2$

$$C_1 V_1 = C_2 V_2 \quad V_1 = \frac{C_2 V_2}{C_1} \quad V_1 = \frac{(0.10 \text{ mol/L})(2.0 \text{ L})}{18 \text{ mol/L}} = 0.01 \text{ L}$$

(ii) ~ calculating final concentration ~

A solution is prepared by adding 600 mL of distilled water to 100 mL of 0.15 mol/L ammonium nitrate. Calculate the molar concentration of the diluted solution.

1- write the given information and convert to appropriate units

$$\begin{aligned} C_1 &= 0.15 \text{ mol/L} \\ V_1 &= 100 \text{ mL} \times \frac{\text{L}}{1000 \text{ mL}} = 0.1 \text{ L} \\ C_2 &= ? \\ V_2 &= 600 \text{ mL} + 100 \text{ mL} = 700 \text{ mL} \times \frac{\text{L}}{1000 \text{ mL}} = 0.7 \text{ L} \end{aligned}$$

2- use formula
 $C_1 V_1 = C_2 V_2$

$$C_1 V_1 = C_2 V_2 \quad C_2 = \frac{C_1 V_1}{V_2} = \frac{(0.15 \text{ mol/L})(0.1 \text{ L})}{0.7 \text{ L}} = 0.021 \text{ mol/L}$$

(iii) ~ calculating required volume for dilution ~

How much water would I need to add to 500 mL of a 2.4 M KCl solution to make a 1.0 M solution?

1- write the given information and convert to appropriate units

$$\begin{aligned} C_1 &= 2.4 \text{ g/mol KCl} \\ V_1 &= 500 \text{ mL} \times \frac{\text{L}}{1000 \text{ mL}} = 0.5 \text{ L} \\ C_2 &= 1.0 \text{ g/mol} \\ V_2 &= ? \end{aligned}$$

2- use formula
 $C_1 V_1 = C_2 V_2$

$$C_1 V_1 = C_2 V_2 \quad V_2 = \frac{C_1 V_1}{C_2} = \frac{(2.4 \text{ mol/L})(0.5 \text{ L})}{1.0 \text{ mol/L}} = 1.2 \text{ L}$$

3- find difference between V_1 and V_2

$$\text{amount added} = V_2 - V_1 = 1.2 \text{ L} - 0.5 \text{ L} = 0.7 \text{ L}$$

Creating Standard Solutions

Standard solution: solution containing precisely known concentration of a substance

uses: determine unknown concentrations of other substances via titration
as tested concentrations in scientific investigations

Preparing molar standard solutions (mol L^{-1}) using solid solute:

Part A: Calculate amount of solute needed

1 - Determine desired concentration and volume

ex: 500 mL of 0.5 M NaCl

2 - Calculate mass of solute needed using $n = CV$

$$\begin{aligned} \text{ex: } n &= (0.5 \text{ mol L}^{-1})(0.5 \text{ L}) \\ &= 0.25 \text{ mol} \times \frac{58.44 \text{ g}}{\text{mol}} \\ &= 14.61 \text{ g of NaCl needed} \end{aligned}$$

Part B: preparing solution

1 - weigh 14.61 g of NaCl on a weighing boat using electronic scale ($\pm 0.01 \text{ g}$) - fig. 1

2 - add ~ 100 mL of distilled water to a 250 mL beaker

3 - transfer 14.61 g of NaCl to beaker and stir with rod until dissolved. - fig. 2
Add more water if necessary

4 - transfer solution into 500 mL volumetric flask ($\pm 0.5 \text{ mL}$) using a funnel. Ensure all of solute is transferred by rinsing beaker with squirt bottle of water - fig. 3

5 - Add distilled water to flask until ~1 cm below mark on neck. - fig. 4

6 - Insert stopper and while holding it down with thumb, shake and invert flask multiple times

7 - While looking at mark at eye level, carefully add water using squirt bottle until bottom of meniscus reaches mark - fig. 5

fig. 1

fig. 2

fig. 3

fig. 4

fig. 5

Preparing molar standard solutions (mol L^{-1}) by dilution:

Part A: Calculate amount of solute needed

1 - Determine desired concentration and volume

ex: 100 mL of 0.1 M NaCl

2 - Determine concentration of initial standard solution

ex: 0.5 M NaCl (aq)

3 - Calculate volume of solvent needed for dilution

$$\text{ex: } V_1 = \frac{C_2 V_2}{C_1} = \frac{(0.1 \text{ M})(0.1 \text{ L})}{(0.5 \text{ M})} = 0.02 \text{ L} \times \frac{1000 \text{ mL}}{\text{L}} = 20 \text{ mL of 0.5 M NaCl needed}$$

Part B: preparing solution

1 - measure 20 mL of 0.5 M NaCl solution using 50 mL graduated cylinder ($\pm 0.5 \text{ mL}$)

2 - transfer solution into 100 mL volumetric flask ($\pm 0.1 \text{ mL}$) using a funnel - fig. 6

3 - Add distilled water to flask until ~1 cm below mark on neck. - fig. 4

4 - Insert stopper and while holding it down with thumb, shake and invert flask multiple times

5 - While looking at mark at eye level, carefully add water using squirt bottle until bottom of meniscus reaches mark - fig. 5

fig. 6

Creating Percentage Solutions

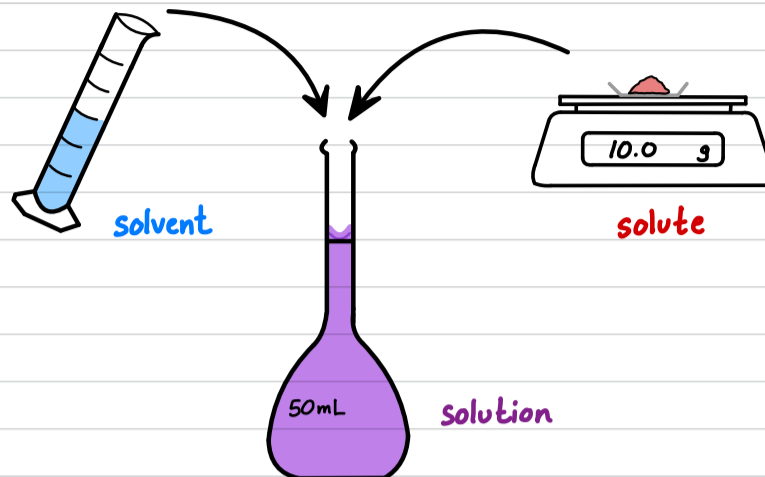

Preparing % mass/volume solutions (% m/v):

→ these solutions are made using solid solute dissolved in liquid solvents

$$\% \text{ m/v} = \frac{\text{mass of solute (g)}}{\text{volume of solution (mL)}} \times 100$$

ex: You want to prepare 50 mL of 20% sucrose solution
How much solute and solvent do you need?

$$\begin{aligned} \text{solute (g)} &= \frac{\text{solution (mL)} \times \%}{100} \\ &= \frac{(50 \text{ mL})(20\%)}{100} \\ &= 10 \text{ g of sucrose dissolved into 50 mL of water} \end{aligned}$$

Preparing % volume/volume solutions (% v/v):

→ these solutions are made using liquid solute dissolved in liquid solvents

$$\% \text{ v/v} = \frac{\text{volume of solute (mL)}}{(\text{volume of solute (mL)} + \text{volume of solvent (mL)})} \times 100$$

ex: You want to prepare 100 mL of 5% HCl solution
How much solute and solvent do you need?

$$\begin{aligned} \text{solute (mL)} &= \frac{\text{solution (mL)} \times \%}{100} \\ &= \frac{(100 \text{ mL})(5\%)}{100} \\ &= 5 \text{ mL of HCl} \end{aligned}$$

$$\begin{aligned} \text{solvent (mL)} &= \text{solution (mL)} - \text{solute (mL)} \\ &= 100 \text{ mL} - 5 \text{ mL} \\ &= 95 \text{ mL of water} \end{aligned}$$

Preparing % mass/mass mixtures (% m/m):

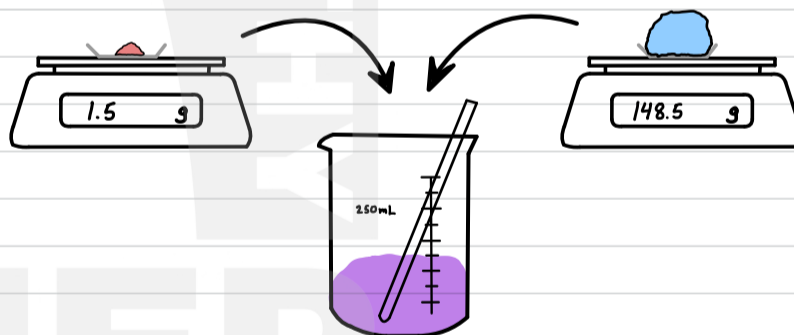

→ these mixtures are often made using different solids

$$\% \text{ m/m} = \frac{\text{mass of solute (g)}}{(\text{mass of solute (g)} + \text{mass of 'solvent' (g)})} \times 100$$

ex: You want to prepare 150g of 1% NaCl in sand mixture
How much NaCl and sand do you need?

$$\begin{aligned} \text{NaCl (g)} &= \frac{\text{solution (g)} \times \%}{100} \\ &= \frac{(150 \text{ g})(1\%)}{100} \\ &= 1.5 \text{ g NaCl} \end{aligned}$$

$$\begin{aligned} \text{sand (g)} &= \text{solution (g)} - \text{solute (g)} \\ &= 150 \text{ g} - 1.5 \text{ g} \\ &= 148.5 \text{ g of sand} \end{aligned}$$

* note: water has a density of 1 g mL^{-1} ∴ 1g water = 1 mL of water
